Go Figure!

Kia and Anthony were put in charge of buying a gift for their science teacher. The entire grade was going to split the cost of the gift. While calculating the cost per student the problem resulted in a quotient of 6 with a remainder of 25. Kia and Anthony decided to double-check the answer by multiplying the quotient with the divisor and adding the remainder. The result was 631. Unfortunately, 631 did not match the original correct dividend. They had mistaken a 2 (the second figure of the divisor from the right) for a zero. **What was the original correct division problem?**

Provide an explanation as to how you determined the correct response along with the correct original division problem. **You must give an accurate explanation.** Have fun, and see you next year!

Did you know that the average person blinks between 4 to 5 million times a year?

Dr. Fracaro
